Brain Coaching — Cloud Agent Prompt (PRD se)

Neeche wala prompt COPY karke cursor.com/agents me PASTE karo:

Build "Brain Coaching" — a Mood-Based Daily Coach mobile app using Flutter (ONE codebase for Android AND iOS).

APP CONCEPT

The app detects the user's mental state (mood, focus, calm) and coaches their day: it plans activities based on focus level, suggests mood-fixing actions, and learns what works per person. Freemium model: free phone version now, headband (EEG) premium later — build the phone version with MOCK data for now.

SCREENS (build in this order)

1. Home Screen

- Top: greeting "Subah Bakhair!" (support English + Roman Urdu toggle)
- Center: 5 mood emoji buttons (😊 🙂 😐 😟 😢) — user taps current mood
- Big button: "Check My Brain"
- Bottom navigation: Home | Insights | Coach | Profile

2. Daily Coach Screen

- Header: "Today: Focus 35%" (mock value)
- Timeline of day with recommended activities
- Example cards: "Morning: light work", "Afternoon: walk", "Evening: rest"
- Tip card: "Aaj focus 35% hai — bhari meeting mat rakho, halka kaam karo"

3. Insights Screen

- Weekly mood line chart (7 days, mock data)
- Stat cards: "Calm 65%", "Focus 40%"
- Insight card: "You feel low on Monday nights" (pattern detection placeholder)

4. Decision Helper ("Dil vs Dimagh") Screen

- User enters a problem + 2 options (Option A / Option B text fields)
- "Option A socho (30 sec)" → mock measure button → "Option B socho (30 sec)" → mock measure
- Result: "Dil Score" bar vs "Dimagh Score" bar with verdict text
- Note: "Ye khayal parhna nahi — emotional response ka andaza hai"

5. Coach Screen (CBT basics)

- "Negative Pattern" card with 3 steps: 1) Pehchano 2) Challenge Karo 3) Badlo
- Simple interactive: user writes a negative thought → app shows reframe questions ("Kya ye har dafa hota hai? Saboot kya hai?")

6. Profile Screen

- User name, app language toggle (English / Roman Urdu), mock stats

DESIGN

- Colors: deep navy blue (#1A237E) primary + gold (#FFD54F) accents, white backgrounds
- Modern, clean, calm aesthetic — this is a wellness app
- Rounded cards, soft shadows, large touch targets
- All text must support English AND Roman Urdu (use a simple strings map, no hardcoded text)

TECHNICAL

- Flutter latest stable, one codebase → Android + iOS
- State management: Riverpod (or Provider if simpler)
- Mock data layer: a single `MockBrainService` class returning fake mood/focus values — clearly separated so real sensors plug in later
- NO backend needed yet — local state only
- Clean code with comments

START NOW

Build the Home screen first with bottom navigation skeleton. Then add each screen one by one. Run `flutter analyze` and fix all issues before finishing.
